Gene duplication and genetic exchange drive the evolution of S-RNase-based self-incompatibility in Petunia

Kubo, Ken-ichi ; Paape, Timothy ; Hatakeyama, Masaomi ; Entani, Tetsuyuki ; Takara, Akie ; Kajihara, Kie ; Tsukahara, Mai ; Shimizu-Inatsugi, Rie ; Shimizu, Kentaro K ; Takayama, Seiji

Abstract: Self-incompatibility (SI) systems in flowering plants distinguish self- and non-self pollen to prevent inbreeding. While other SI systems rely on the self-recognition between specific male- and female-determinants, the Solanaceae family has a non- self recognition system resulting in the detoxification of female-determinants of S-ribonucleases (S-RNases), expressed in pistils, by multiple male-determinants of S-locus F-box proteins (SLFs), expressed in pollen. It is not known how many SLF components of this non-self recognition system there are in Solanaceae species, or how they evolved. We identified 16–20 SLFs in each S-haplotype in SI Petunia, from a total of 168 SLF sequences using large-scale next-generation sequencing and genomic polymerase chain reaction (PCR) techniques. We predicted the target S-RNases of SLFs by assuming that a particular S-allele must not have a conserved SLF that recognizes its own S-RNase, and validated these predictions by transformation experiments. A simple mathematical model confirmed that 16–20 SLF sequences would be adequate to recognize the vast majority of target S-RNases. We found evidence of gene conversion events, which we suggest are essential to the constitution of a non-self recognition system and also contribute to self-compatible mutations.

Supplementary Methods

Plant materials. Lines of S_5-, S_7-, S_9- and S_{11}-haplotypes from *Petunia hybrida*[9,51] and the lines of S_{17}-, S_{19}- and S_{C2}-haplotypes from *P. axillaris*[21,52] were described previously. In this research, we used additional lines of S_{10}-, S_{22}-, S_{0m}-, S_m-, and S_{22m}-haplotypes from *P. hybrida.* Homozygous self-compatible lines of S_m- and S_{0m}-haplotypes were the doubled-haploid line "Mitchell" and the inbred line W138, respectively[53]. *S-RNase* sequences were identified by degenerate PCR using primer sequences listed in Supplementary Table 3. *S-RNase* sequence from Mitchell (S_m-*RNase*) was novel, but *S-RNase* from W138 was identical with previously identified S_0-*RNase* from commercial SC *P. hybrida* cv. Strawberry Daddy[54]. Because we cannot judge the identity of *S*-haplotype only from *S-RNase* sequence, we named *S*-haplotype from W138 as S_{0m} in this work. Homozygous lines of S_{10}-, S_{22}- and S_{22m}-haplotypes were established in this work from three commercial lines of *P. hybrida*. We determined S_{22m}- and S_{C2}-haplotypes as pollen-side SC haplotypes by reciprocal pollination with S_{22}- and S_{17}-homozygous plants, respectively (Supplementary Fig. 10a,b; see main text). We confirmed that SC phenotypes were genetically linked to the *S*-locus in all SC lines.

The interspecific crosses between the lines from *P. hybrida* and *P. axillaris* were compatible, and all the resulting progenies were fertile. Therefore, we do not distinguish them, and simply refer to them as '*Petunia*' in this article.

Expression profiling. Template preparations and reaction conditions were described previously[9]. We conducted RT-PCR using *SLF* genes-specific primers (listed in Supplementary table 2) with 32 cycles for all of *SLF*s except for S_5-*SLF18*, for which reaction was conducted with 28 cycles.

Vector construction. Fragments containing open reading frames (ORFs) of S_5-*SLF3*, S_7-*SLF3*, S_{11}-*SLF3B*, S_7-*SLF9A* and S_{11}-*SLF9* were amplified with forward primers containing *Bam*HI sites and reverse primers containing *Sac*I sites. *pRI909-LAT52-pro:TAP:*S_{11}*-SLF3-35Spro:AtFT-LAT52-pro:Venus* plasmid vector[9] was digested with *Bam*HI and *Sac*I, and the S_{11}-*SLF3* coding region was replaced with these amplified fragments to yield vectors listed in Supplementary Fig. 3.

Plant transformation and *in vivo* function assay. S_7-*SLF1*-expressing plants with S_{22}-haplotype were obtained by crossing with S_7-*SLF1*-transgenic plants previously described[9]. Other transgenic plants were newly obtained by *Agrobacterium*-mediated plant transformations described previously[9]. Breeding histories, genotypes and SI phenotypes of all transgenic lines are listed in Supplementary Table 4.

Genotyping and linkage analysis by genomic PCR. Genotyping of transgenic plants and linkage analysis were performed as described[9]. Progenies segregating for S_5-, S_7-, S_9-, S_{11}-haplotypes were obtained from $S_5S_{11} \times S_7S_9$ and $S_5S_9 \times S_7S_{11}$ crosses, and progenies segregating for S_{17}- and S_{19}-haplotypes were obtained from $S_{17}S_{19} \times S_5S_5$ and $S_{11}S_{11} \times S_{17}S_{19}$ crosses. Gene-specific primers not described[9] are listed in Supplementary Table 2.

Preparation of cDNA libraries and next generation sequencing. Total RNA was extracted from mature pollen of an S_7-homozygous plant and unopened mature anthers of S_5-, S_9-, S_{11}-, S_{17}-, S_{19}- and S_{0m}-homozygous plants, as described previously[9]. For sequencing of anther transcripts from S_{0m}-homozygous plant, poly $(A)^+$ RNA were enriched using Oligotex-dT30 super (Takara), and the preparation of cDNA library and the sequencing using GS Junior system were performed at Roche Diagnostics Japan (http://www.roche-diagnostics.jp). For sequencing of transcripts from other plants, cDNA libraries were prepared from total RNA using the SMARTer PCR cDNA synthesis kit (Clontech). Sequencings were performed using Roche 454 Genome Sequencer FLX System at Hokkaido System Science (for S_7-homozygous plant), and at the Functional Genomics Center Zurich (for all other plants). The sequenced reads information is summarized in Supplementary Table 14.

Monte-Carlo simulation of S-RNase proportion recognized by SLFs. Monte-Carlo simulation was conducted in order to consider the difference of recognition rates among SLF types. The proportion of S-RNases recognized by n SLF types, $P_S(n)$, was simulated by the following equation (4):

$$P_S(n) = \frac{\sum_{i=1}^{m} P_{Mi}(n)}{m} \qquad (4)$$

$$P_{Mi}(n) = 1 - \prod_{j=1}^{n}(1 - P_{Tj})$$

where m is the number of bootstrapping sampling times and the n elements of $\{P_{Tj}\}$ are selected in each bootstrapping sampling time i at random with replacement from the recognition rates of each SLF type,

$$P_T := \left\{\frac{6}{12}, \frac{3}{6}, \frac{1}{6}, \frac{1}{8}, \frac{1}{8}, \frac{1}{8}, \frac{1}{8}, \frac{1}{6}, \frac{0}{6}\right\}. \quad (5)$$

P_{Ti} corresponds to the recognition rate of SLF type i (Supplementary Table 13b). To calculate P_T, the recognition rates of SLF type, the interaction between SLF type and a particular S-RNase allelic variant is considered positive, when one or more allelic variants of the SLF type showed positive interaction experimentally. In this simulation, we used m = 10,000 times as bootstrapping sampling iteration. The Monte-Carlo simulation is implemented and performed in Ruby (ver. 1.9.3) (Supplementary Material). Mersenne Twister[55] was used for the random number generator in the Ruby script.

Supplementary Material Ruby script code that realizes the Monte-Carlo simulation for the estimation of the proportion of S-RNases recognized by *n* SLF types described in the Online Method.

Supplementary Figure 1 Phylogeny of SLFs from *Petunia*. Phylogenetic tree of deduced amino-acid sequences of SLFs shown in Fig.1 is described without the compressed representation. For details, see METHODS and caption of Fig. 1. Based on this phylogeny, previously identified *S_7-SLF3* (Ref. 9) is now assigned into a clade type-13, and renamed as *S_7-SLF13*. Instead, we newly identified *SLF* that belongs to the type-3 clade from S_7-haplotype, and named it as *S_7-SLF3*. The phylogeny also suggests that the previously identified *SLF*-like genes, *SLFLa*, *SLFLb*, *A113* and *A134*, are alleles of type 7–10 *SLF*s, and renamed as *SLF7*, *SLF8*, *SLF9*, and *SLF10*, respectively[37,56]. Information of accession codes and synonyms of *SLF*s used in this phylogenetic analysis was summarized in Supplementary Tables 1 and 9.

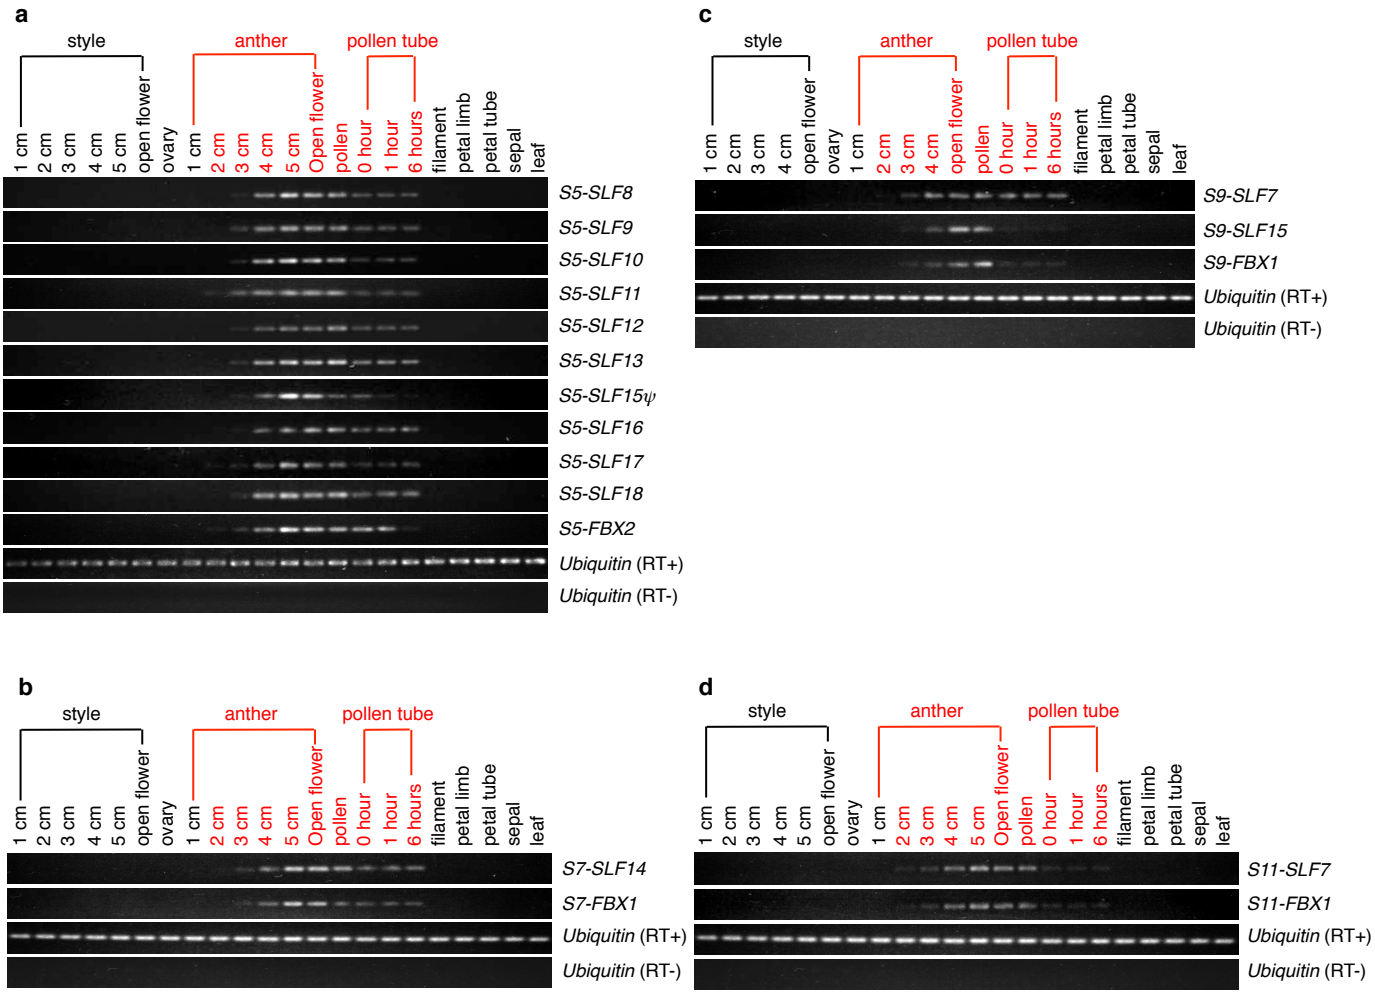
Supplementary Figure 2 Genetic linkage between *SLF*s and *S-RNase*. (**a**) PCR was performed using genomic DNA prepared from *S*-homozygous plants to evaluate the specificity of primer pairs. Primers are listed in Supplementary Table 2. (**b, c**) Genetic linkage analyses between *S-RNase* and *SLF* genes of S_5-, S_7-, S_9- and S_{11}-haplotypes. PCR was performed using genomic DNA prepared from 48 progeny plants of an $S_5S_{11} \times S_7S_9$ cross (b), and from 48 progeny plants of an $S_5S_9 \times S_7S_{11}$ cross (c). (**d, e**) Genetic linkage analyses between *S-RNase* and *SLF* genes of S_{17}- and S_{19}-haplotypes. PCR was performed on genomic DNA prepared from 48 progeny plants of an $S_{11}S_{11} \times S_{17}S_{19}$ cross (d) and from 48 progeny plants of an $S_{17}S_{19} \times S_5S_5$ cross (e).



Supplementary Figure 3 Newly isolated *SLF* genes show a male reproductive organ-specific expression profile. RT-PCR analyses of the expression profiles of six types of *SLF* genes in (**A**) S_5-, (**B**) S_7-, (**C**) S_9- and (**D**) S_{11}-homozygotes. cDNA was prepared from each *S*-homozygote, and Type-7 to Type-18 *SLF*s and ungrouped *SLF*-like F-box (*FBX*) genes were amplified by specific primer pairs. The *ubiquitin* gene was also amplified and electrophoresed as a control. All primer sequences are shown in Supplementary Table 2.

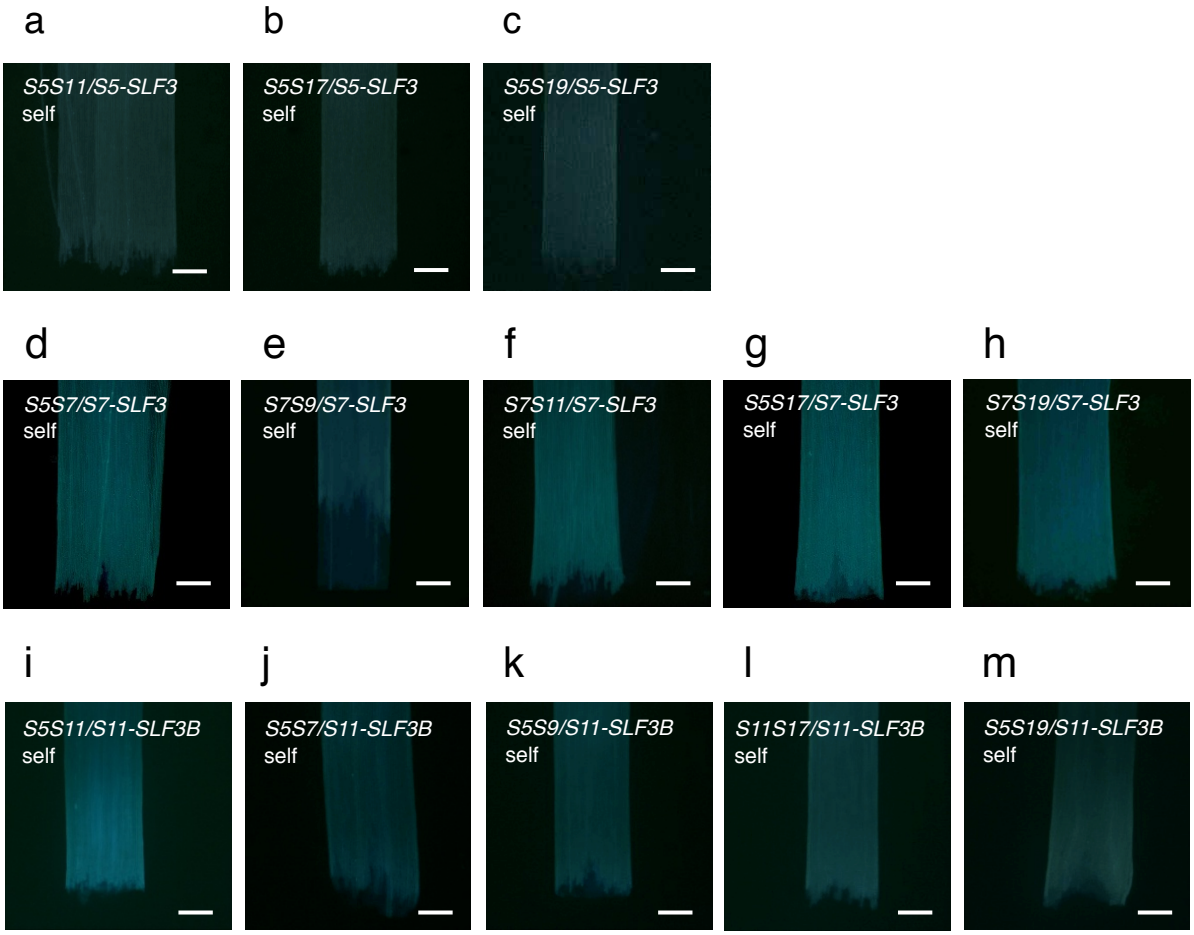
Supplementary Figure 4 Schematic representation of transgene constructs used for transformation experiments. The region between the right border (RB) and left border (LB) is integrated into transgenic plants. *Nos*, the gene encoding nopaline synthase; *pro*, promoter; *ter*, transcription terminator; *LAT52-pro*, pollen/pollen tube-specific *LAT52* promoter of tomato[57]; *35S-pro*, Cauliflower mosaic virus *35S* promoter; *S_5-SLF18-pro*, 2028 bp of the upstream region of the *S_5-SLF18* gene; *NPTII*, the gene encoding neomycin phosphotransferase II (conferring kanamycin resistance); *AtFT*, *Arabidopsis thaliana FLOWERING LOCUS T* gene (accelerating flowering and to shortening the experimental time period)[58]; *Venus*, the gene encoding enhanced yellow fluorescent protein[59]. Small arrows denote the locations of the forward and reverse primers used in PCR genotyping and RT-PCR analysis of each transgene (for primer sequences, see Supplementary Table 2).



Supplementary Figure 5 Representative results of transgenic experiments to detect the *in vivo* interaction between type-3 SLFs and S_7-RNase. (**a**–**c**) Pollen tubes derived from *S_5-SLF3* transgenic plants were stained with aniline blue and monitored by fluorescence microscopy. The *S_5S_{11}/S_5-SLF3* (**a**), *S_5S_{17}/S_5-SLF3* (**b**) and *S_5S_{19}/S_5-SLF3* (**c**) transgenic plants retained SI, indicating that S_5-SLF3 did not recognize and detoxify S_5-, S_{11}-, S_{17}-, and S_{19}-RNases. (**d**–**h**) Pollen tubes derived from *S_7-SLF3*–transgenic plants were stained with aniline blue and monitored by fluorescence microscopy. All transgenic plants exhibited SI, indicating that S_7-SLF3 did not recognize and detoxify S_5-, S_7-, S_9-, S_{11}-, S_{17}-, and S_{19}-RNases. (**i**–**m**) Pollen tubes derived from *S_{11}-SLF3B*–transgenic plants were stained with aniline blue and monitored by fluorescence microscopy. All transgenic plants exhibited SI, indicating that S_{11}-SLF3B did not recognize and detoxify S_5-, S_7-, S_9-, S_{11}-, S_{17}-, and S_{19}-RNases. Bars = 200 μm.

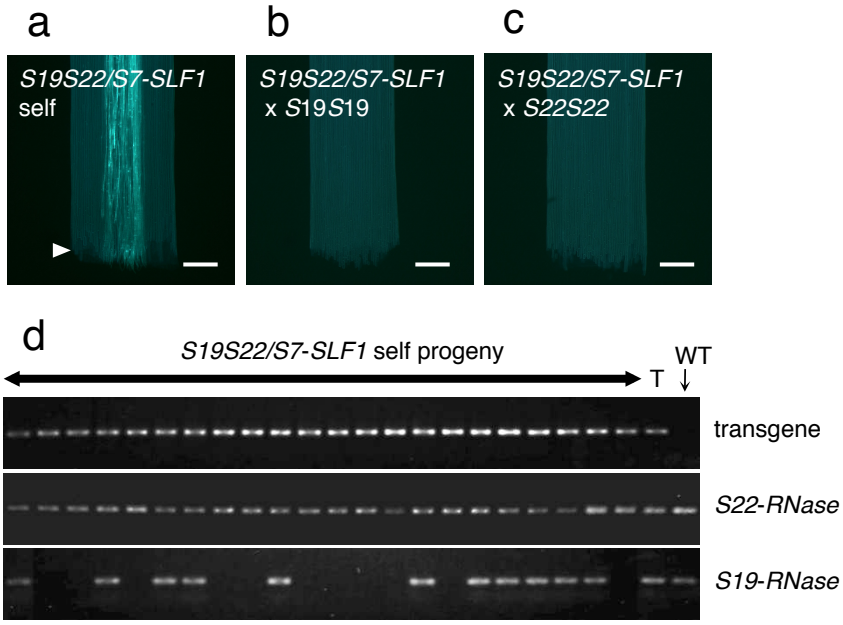
sup. Fig. 6

Supplementary Figure 6 Representative results of transgenic experiments to demonstrate *in vivo* interaction between type-9 SLFs (S_7-SLF9A, and S_{11}-SLF9) and S_{19}-RNase. (**a–g**) Pollen tube growth derived from *S_7-SLF9A*–transgenic plants. *S_5S_7/S_7-SLF9A* (**a**), *S_7S_9/S_7-SLF9A* (**b**), *S_7S_{11}/S_7-SLF9A* (**c**) and *S_7S_{17}/S_7-SLF9A* (**d**) retained SI, suggesting that S_7-SLF9A does not recognize S_5-, S_7-, S_9-, S_{11}- and S_{17}-RNases. *S_5S_{19}/S_7-SLF9A* (**e**) exhibited SC. The reciprocal cross (**f, g**) indicated the SI breakdown occurred in pollen. (**h**) PCR genotyping of 22 progeny plants obtained by crossing *S_5S_{19}* (WT) with pollen from *S_5S_{19}/S_7-SLF9A* (T). These results suggest that S_7-SLF9A recognizes S_{19}-RNase as a target. (**i-p**) Pollen tube growth derived from *S_{11}-SLF9*–transgenic plants. *S_5S_{11}/S_{11}-SLF9* (**i**), *S_5S_7/S_{11}-SLF9* (**j**), *S_5S_9/S_{11}-SLF9* (**k**) and *$S_{11}S_{17}$/S_{11}-SLF9* (**l**) retained SI, suggesting that S_{11}-SLF9 does not recognize S_5-, S_7-, S_9-S_{11}- and S_{17}-RNases. *S_5S_{19}/S_{11}-SLF9* (**m**) exhibited SC. The reciprocal cross (**n, o**) indicated the SI breakdown occurred in pollen. (**p**) PCR genotyping of 22 progeny plants obtained by crossing *S_5S_{19}* (WT) with pollen from *S_5S_{19}/S_{11}-SLF9* (T). These results suggest that S_{11}-SLF9 recognizes S_{19}-RNase as a target. Bars = 200 μm.



Supplementary Figure 7 Representative results of transgenic experiments to demonstrate the *in vivo* interaction between S_7-SLF1 and S_{22}-RNase. (**a**-**c**) Pollination phenotype of *$S_{19}S_{22}$/S_7-SLF1* transgenic plants. *$S_{19}S_{22}$/S_7-SLF1* exhibited breakdown of SI (a), whereas pistil of *$S_{19}S_{22}$/S_7-SLF1* retained incompatibility against pollen from *S_{19}*-homozygote (b) and *S_{22}*-homozygote (c). (**d**) PCR genotyping of 22 progeny plants obtained by selfing of *$S_{19}S_{22}$/S_7-SLF1* (T).

Supplementary Figure 8 Phylogenies of SLF-related F-boxes from species possessing S-RNase-based SI. (**a**) Whole tree constructed by using *Petunia* SLFs and all BLAST hits from the tomato and potato databases, as well as other SLF-related F-box proteins from Solanaceae, Plantaginaceae, and Rosaceae. PiFBP2011 and PiFBP2411 from *Petunia inflata* were used as the outgroup[60]. For other details, see Online Methods and the caption of Fig. 3. In this tree, Solanaceae SLF, Antirrhinum SLF, Prunus SLFL, and Maloideae SFBB clades are shown in compressed representation (black triangles). A subtree of Solanaceae SLFs is shown in Fig. 3a. (**b**) Subtree of SLF clade in (a) is shown. *Petunia* SLFs types are shown in compressed representation (black triangles). (**c**) Subtree of Solanaceae SLF clade (see Fig. 3a) is shown without compression. Round red markers indicate *SLF*s from genus *Petunia* (*P. hybrida*, *P. axillaris* and *P. inflata*); blue, genus *Solanum* (*Solanum lycopersicum*, *S. tuberosum* and their relatives); green, genus *Nicotiana*. 'PGSC0003DMG' is omitted from each potato gene ID to simplify, and '-STchx' is attached to indicate genes located on *S. tuberosum* chromosome x.

Prunus S-RNases
0.1

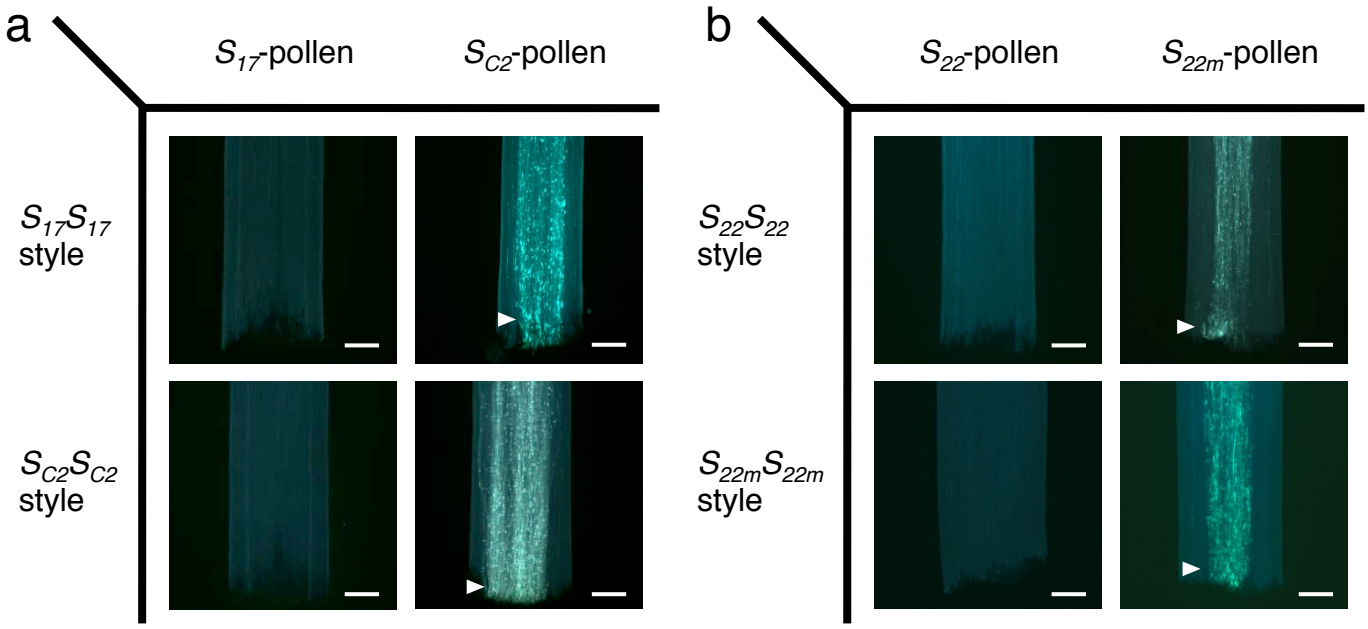
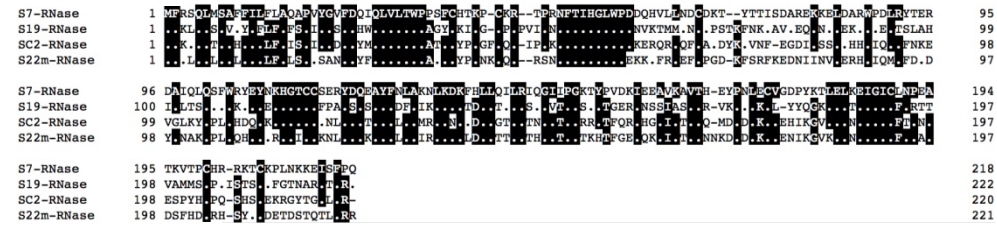
sup. Fig. 9

Supplementary Figure 9 Phylogenies of S-RNase-related RNase-T2s from species possessing S-RNase-based SI. (**a**) Whole tree constructed using *Petunia* S-RNases and all hits from BLAST searches of the tomato and potato databases, as well as other RNase-T2s from Solanaceae, Plantaginaceae and Rosaceae. Classification of RNase-T2 is made according to refs. 61 and 62. RNase-T2s from human and the filamentous fungus *Rhizopus niveus* were used as outgroup[63,64]. For other details, see METHODS and the caption of Fig. 3. In this tree, S-RNase clades from Solanaceae, Antirrhinum, Prunus, and Maloideae are shown in compressed representation (black triangles). A subtree of Solanaceae S-RNases clade is shown in Fig. 3b. (**b**) Subtree of S-RNase clade in (a) is shown without compression.

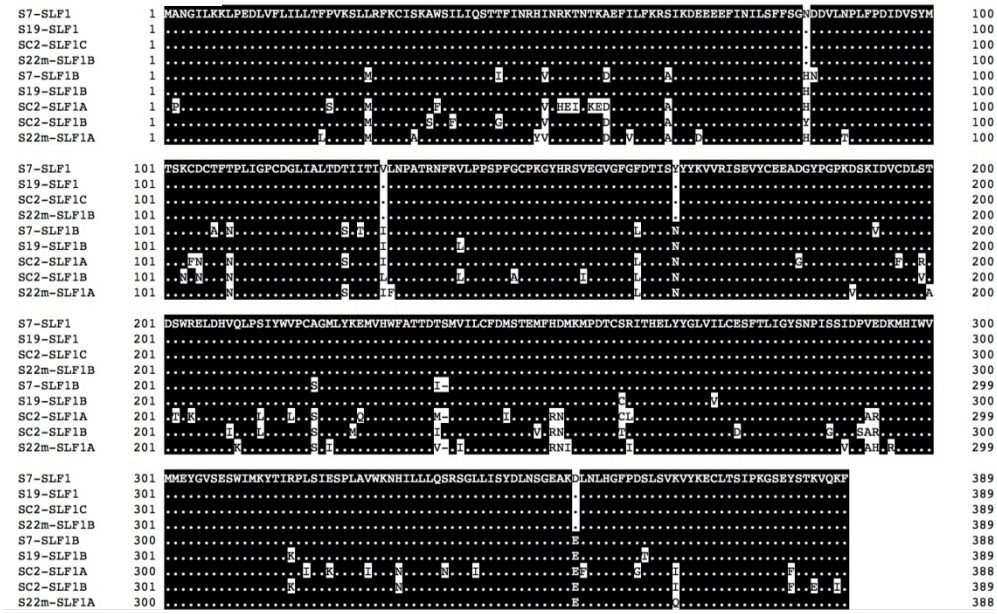


Supplementary Figure 10 S_{C2}- and S_{22m}-haplotypes are the pollen-side SC haplotypes. Reciprocal pollination tests between SC S_{C2}- and SI S_{17}-homozygous plants (**a**) and between SC S_{22m}- and SI S_{22}-homozygous plants (**b**). Pollen tubes were stained with aniline blue, and the compatibility was judged by the presence of a large number of pollen tubes at the basal end of the style (arrowhead). Bars = 200 μm.

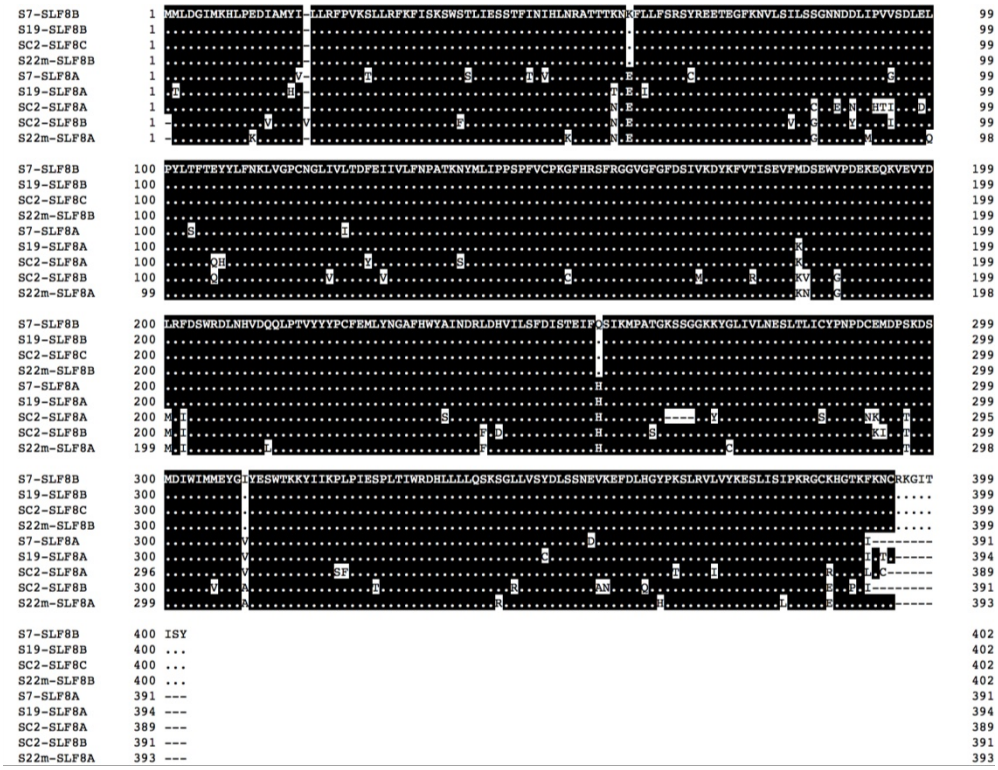
a. S-RNases



b. SLF1s

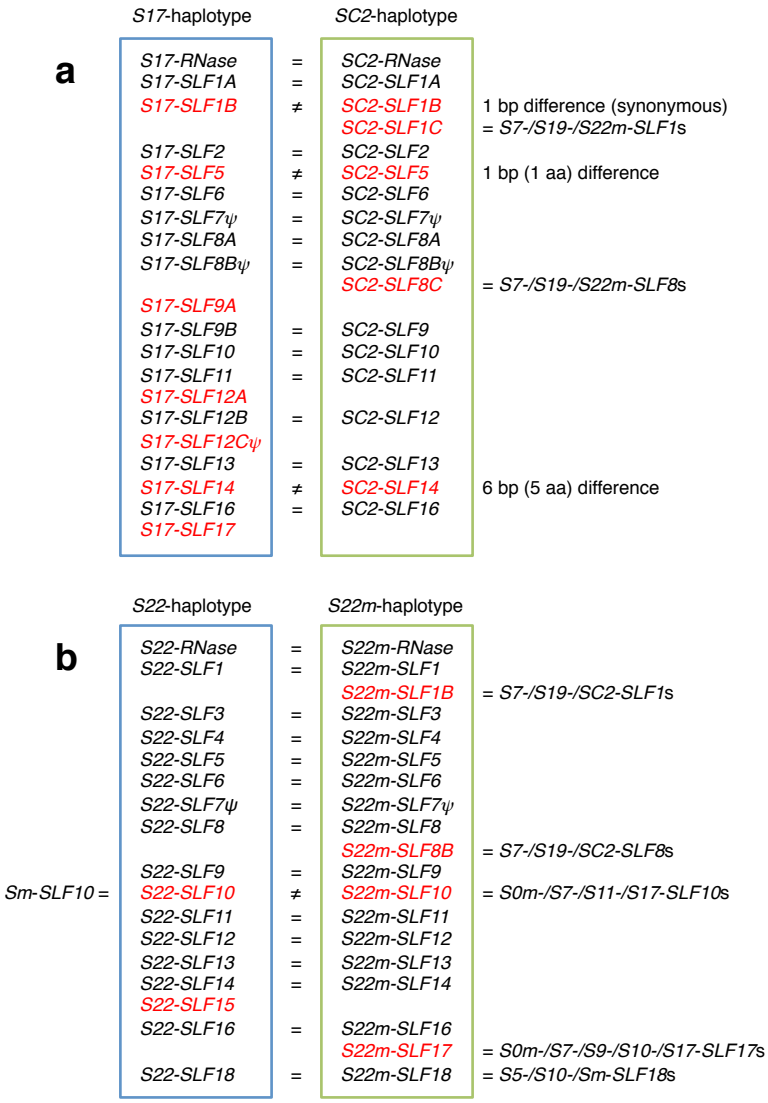


c. SLF8s

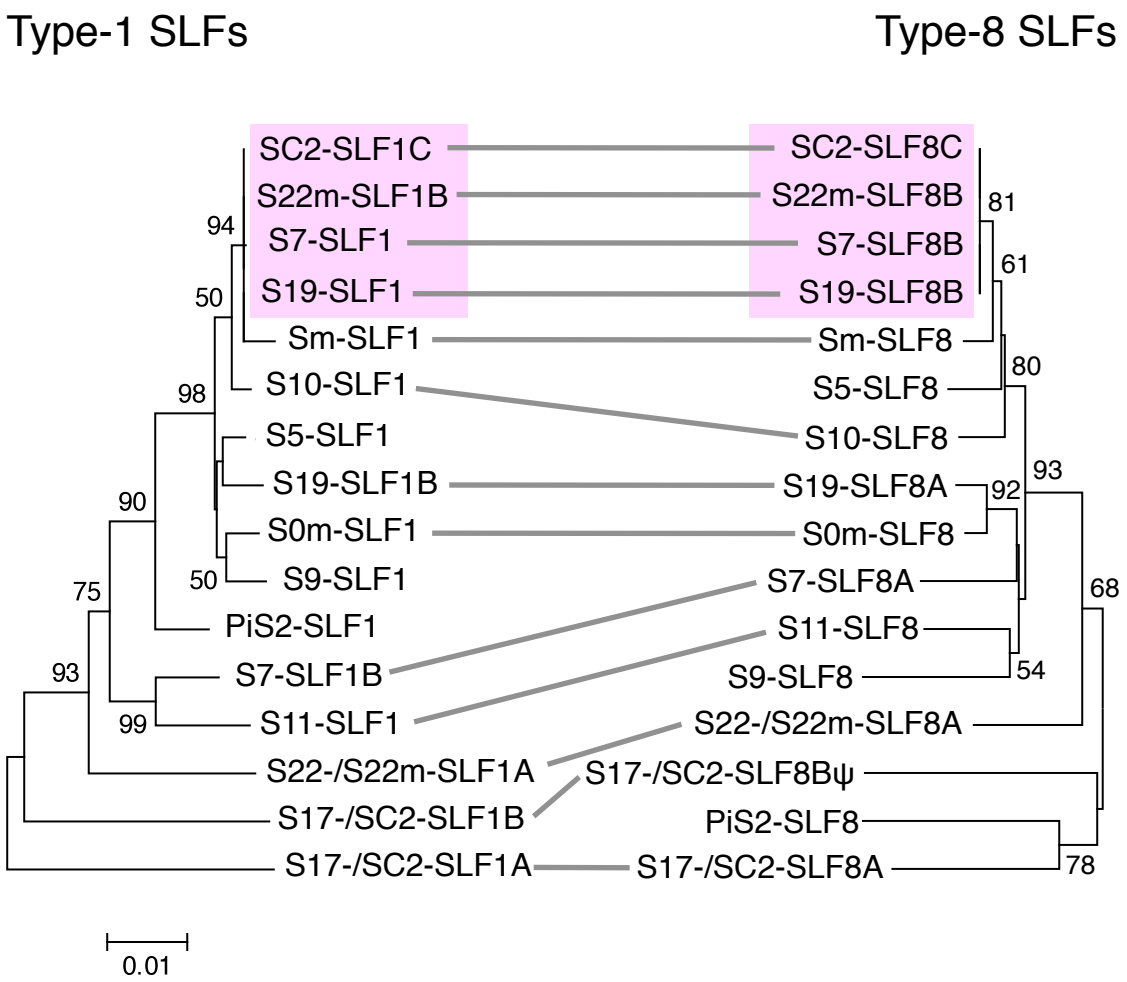


sup. Fig. 11

Supplementary Figure 11 S_7-, S_{19}-, S_{22m}-, S_{C2}-haplotypes share identical *SLF1* and *SLF8*. Alignment of deduced amino-acid sequences of S-RNases (**a**), SLF1s (**b**) and SLF8s (**c**) from S_7-, S_{19}-, S_{22m}-, and S_{C2}-haplotypes of *Petunia*. Deduced amino-acid sequences were aligned using MEGA5.2.2 and illustrated using the GENETYX-MAC (ver. 16.0.6). Amino-acid residues conserved in more than half of the aligned sequences are shown by darkened background. Amino-acid residues identical with the first line are indicated by dots. Gaps are indicated by hyphens.



Supplementary Figure 12 Self-compatible S_{C2}- and S_{22m}-haplotypes have different *SLF* repertoires from self-incompatible S_{17}- and S_{22}-haplotypes, respectively. Red characters indicate differential *SLF*s. ψ indicates pseudogene. (**a**) Comparisons of *SLF*-repertoires between S_{C2}- and S_{17}-haplotypes. No gene corresponding to S_{17}-*SLF9A*, S_{17}-*SLF12A* or S_{17}-*SLF17* was found from the S_{C2}-haplotype. 1–6-bp substitutions were detected in *SLF1*, *SLF5* and *SLF14*. (**b**) Comparisons of *SLF*-repertoires between S_{22}- and S_{22m}-haplotypes. Type-3, -4, -5, -6, -7, -8, -9, -11, -12, -13, -14 and -16 *SLF*s shared completely identical sequences, whereas the type-10 *SLF*s had four nucleotide differences affecting three amino acids. We hypothesized that this difference is the result of inter-haplotypic gene exchange, because S_{22}- and S_{22m}-*SLF10*s were identical with S_m-*SLF10* and S_{0m}-/S_7-/S_{11}-/S_{17}-*SLF10*, respectively. Type-15 *SLF* was not found from S_{22m}-haplotype, while type-17 *SLF* was not found from S_{22}-haplotype.



Supplementary Figure 13 Coevolutionary relationships between type-1 and type-8 SLFs. Neighbor-joining phylogenic trees of type-1 and -8 SLFs were created with MEGA 5.2.2. Both trees are shown in the same scale; the bar for each tree indicates the number of base substitutions per site. Numbers on the branches indicate bootstrap values >50% with 1,000 trials. Identical SLF1 and SLF8 shared among four different *S*-haplotypes are highlighted in pink. Horizontal gray lines indicated gene pairs on the same *S*-haplotypes holding similar branching patterns.

ψ following a gene name indicates pseudogene. For *SLF*s of the S_5-, S_7-, S_9-, S_{11}-, S_{17}-, S_{19}- and S_{0m}-haplotypes, relative expression levels are shown in RPKM (Reads Per Kilobase of exon model per Million mapped reads), and total numbers of ESTs are shown at the bottom of each table. GenBank accession IDs and references are also shown.

Supplementary Table 2 List of primer sequences

	Name	Primer		Target / Purpose
Type-7 specific amplification	SLF7-F1	CAA AGT ATA TTT TAC ATT GCA TTG CAG A	F	Type-7 *SLF*s / genomic PCR
	SLF7-F2	GGG TTT TAG AAG ACT ATG GCG ATC	F	Type-7 *SLF*s / 3' RACE, genomic PCR
	SLF7-F3	GTT GAG AAA GTG GAA GAT CGA TGT	F	Type-7 *SLF*s / 3' RACE, genomic PCR
	SLF7-F4	ATG ACT CTC TAA CAC TGA TCT GTT ACC G	F	Type-7 *SLF*s / 3' RACE, expression analysis
	SLF7-R1	GAG AAG GGT AAG CTC TAT TTA AAT TGG	R	Type-7 *SLF*s / genomic PCR
	SLF7-R2	GTA CTC CTT CAT TGT CCA AAT TTC CA	R	Type-7 *SLF*s / 5' RACE, genomic PCR

Pairwise comparisons among allelic *SLF*s of the same type (**a–r**), among *SLF*s of each *S*-haplotype (**s–x**), or among allelic *S-RNase*s (**y**). Shading shows the level of identity. Each value was computed by using the GENETYX-MAC (ver. 16.0.6).

[a] The *S*-haplotype of each transgenic plant that is homoallelic with respect to the transgene is indicated in blue. For each self-compatible (SC) transgenic plant, the *S*-haplotype of pollen that exhibited competitive interaction with the transgene is indicated in red (see also Supplementary Table 6).

[b] "+++" indicates the transcript of a transgene yielding a strong band after 26 cycles of amplification; "++" indicates the transcript of a transgene yielding a strong band after 28 cycles of amplification; "+" indicates the transcript of a transgene yielding a weak or moderate-intensity band after 28 cycles of amplification.

[c] SC and SI phenotypes were judged by the number of the obtained seeds per pod after self-pollination. "+++" indicates more than 100 seeds set per pod; "++" indicates 51–100 seeds set per pod; "+" indicates 10–50 seeds set per pod; and "-" indicates fewer than 10 seeds set per pod. In this work, all self-pollination tests resulted in complete SC phenotype of "+++" or complete SI phenotype of "-". All results were consistently reproduced from at least three independent self-pollinations.

[d] These plants are derived from our previous work[9].

Supplementary Table 5 Analyses of progenies of the transformants that exhibited breakdown of SI

[a]All progeny plants inherited the transgene (*TG*).

[b]Upper ratios are values predicted by competitive interaction; lower ratios are values predicted by simple mendelian inheritance.

Supplementary Table 10 Results of the recombination analysis using LDhat

Dataset	$4N_e r$	corr(r^2, d)	*P*corr(r^2, d)
All *SLF*s	49.721	-0.009	0.016
Type-3 *SLF*s	7.525	-0.023	0.047
Type-9 *SLF*s	2.975	-0.118	0.000
Type-9+10 *SLF*s + *FBX*s [a]	6.397	-0.094	0.000
Type-14+16+17 *SLF*s	8.776	-0.017	0.030

Recombination tests were carried out using the LDhat program[19]. Datasets analyzed were sequence alignments involving each type or some related types of *SLF*s. $4N_e r$, population recombination rate; corr(r^2, *d*), correlations between r^2 and physical distance; *P*corr(r^2, *d*), simulated *p* values based on 1,000 permutations. Only statistically significant results ($p < 0.05$) are shown. [a] "*FBX*s" in this table indicates type 9– and type 10–related, ungrouped *FBX*s: S_{19}-*FBX1*, S_{19}-*FBX2*, S_{0m}-*FBX1*, and S_{0m}-*FBX2*.

Gene conversion events were detected by the GENECONV program[20]. Datasets analyzed were sequence alignments involving each type or some related types of SLFs. Sim*P*, simulated *p* values based on 1,000 permutations. Only statistically significant results ($p < 0.05$) are shown. Begin, first nucleotide of converted region; End, last nucleotide in converted region; Length, length of converted region. [a] "*FBX*s" in this table indicates type 9– and type 10–related, ungrouped *FBX*s: S_{19}-*FBX1*, S_{19}-*FBX2*, S_{0m}-*FBX1* and S_{0m}-*FBX2*. "n.d." indicates that no significant results was detected.

[a] Results cited from ref. 9. S_7-SLF13 is renamed from S_7-SLF3. (See caption of Supplementary Fig. 1.)

[b] Results from this work.

[c] Results cited from ref. 23. *Pi* indicates *Petunia inflata*.

[d] Interactuion between S_{22}-RNase and S_7-SLF1 eliminated from statistical analysis, because this results is based on the prediction and not random trial.

Supplementary Table 13 Statistical analyses of interactions between S-RNase and SLF

Negative and positive interactions between S-RNase and SLF, which were summarized in Supplementary Table 12, were expressed as 0 and 1, respectively.

Supplementary Table 14 Summary of the sequenced reads

Haprotypes	Total number of reads (bp)	Read length (bp)[a]	Mean. read length (bp)	Mean. base quality
S5	590,953	40 - 722	355	32.7
S7	634,016	40 - 1196	288	32.3
S9	550,736	40 - 893	352	32.3
S11	545,880	40 - 764	344	32.2
S17	550,612	40 - 1118	347	32.3
S19	521,109	40 - 987	343	32.1
S0m	101,431	40 - 1118	410	29.2

Total number of reads, read length, mean of read length, and mean of base quality score are shown.
[a] The shortest and the longest lengths.
